# Chapter 1 LLDP Configuration Commands

## 1.1 LLDP Commands

### 1.1.1 lldp run

#### Syntax

**lldp run**

**no lldp run**

To start up LLDP, run **lldp run**; to Disable LLDP, run **no lldp run**.

#### Parameter

None

#### Default

Disabled

#### Usage Guidelines

None

#### Command Mode

Global configuration mode

#### Example

The following command is used to start up LLDP.

```
switch(config)# lldp run
```

### 1.1.2 lldp holdtime

#### Syntax

**lldp holdtime *time***

**no lldp holdtime**

To configure the ttl value of LLDP, run **lldp holdtime *time***. To resume the default transmission delay, run **no lldp holdtime**.

## Parameter

Parameter	Description
<i>time</i>	Storage time of the transmitted message, ranging between zero to 65535 seconds

## Default

120s

## Usage Guidelines

In normal, the remote information stored in the MIB will be updated before its aging. But the update frame may be lost during the transmission process, causing the information in the MIB to age. To prevent this, set the TTL value so that it updates the LLDP frame multiple times during the aging time.

## Command Mode

Global configuration mode

## Example

The following example shows how to set the ttl value of LLDP to 100 seconds.

```
switch(config)# lldp holdtime 100
switch(config)#
```

### 1.1.3 lldp timer

## Syntax

**lldp timer *time***

**no lldp timer**

To configure the transmission interval of LLDP, run **lldp timer *time***. To resume the default transmission delay, run **no lldptimer**.

## Parameter

Parameter	Description
-----------	-------------

<i>time</i>	Interval for transmitting the LLDP message, ranging between 5 to 65534 seconds.
-------------	---

## Default

30s

## Usage Guidelines

The transmission interval of the LLDP message must be shorter than its storage time, ensuring multiple updates in the storage time and preventing error which is led by packet loss.

## Command Mode

Global configuration mode

## Example

The following example shows how to configure the transmission interval of LLDP to 24 seconds.

```
switch(config)# lldp timer 24
switch(config)#
```

### 1.1.4 lldp reinit

## Syntax

**lldp reinit** *time*

**no lldp reinit**

To configure the transmission delay of LLDP, run **lldp reinit time**. To resume the default transmission delay, run **no lldp reinit**.

## Parameter

Parameter	Description
<i>time</i>	Transmission delay of LLDP, whose values range from two to five seconds

## Default

2s

## Usage Guidelines

LLDP information is automatically sent when the status or value of one or more information elements (managed objects) in the local system changes and the transmission timer expires. Since a single information change requires sending LLDP packets, a series of continuous information changes may trigger the transmission of many LLDP frames. Only one change is reported in each frame. To avoid this situation, network management defines waiting time between two consecutively sending LLDP frames.

## Command Mode

Global configuration mode

## Example

The following example shows how to set the transmission delay of LLDP to five seconds.

```
switch(config)# lldp reinit 5
switch(config)#
```

### 1.1.5 lldp transmit

## Syntax

**lldp transmit**

**no lldp transmit**

To set the port to send the LLDP message, run **lldp transmit**. To forbid receiving the LLDP message, run **no lldp transmit**.

## Parameter

None

## Default

Transmittable LLDP message mode

## Usage Guidelines

Only after the LLDP module is started can the command be valid.

## Command Mode

Port configuration mode

## Example

The following example shows how to set port g0/0/1 not to send the LLDP message.

```
switch(config-g0/0/1)# no lldp transmit
switch(config-g0/0/1)#
```

### 1.1.6 lldp receive

#### Syntax

**lldp receive**

**no lldp receive**

To set the port to the receivable LLDP message mode, run **lldp receive**. To forbid receiving the LLDP message, run **no lldp receive**.

#### Parameter

None

#### Default

Receivable LLDP message mode

#### Usage Guidelines

Only after the LLDP module is started can the configuration be valid.

#### Command Mode

Port configuration mode

## Example

The following example shows how to set port g0/0/1 to the LLDP message mode.

```
switch(config-g0/0/1)# no lldp receive
switch(config-g0/0/1)#
```

### 1.1.7 lldp management-ip

#### Syntax

**lldp management-ip A.B.C.D**

**no lldp management-ip**

To configure the management address of the LLDP port, run **lldp management-ip A.B.C.D**. To resume the default transmission delay, run **no lldp management-ip**.

## Parameter

Parameter	Description
<i>A.B.C.D</i>	Stands for the management IP address that will be specified.

## Default

The default management address is the IP of vlan interface corresponding to pvid. If the IP is not existed, the default management address is 0.0.0.0.

## Usage Guidelines

The configured management IP address should be the IP address related with a port.

## Command Mode

Interface configuration mode

## Example

The following example shows how to set the management IP address of the port g0/0/1 to 90.0.0.99:

```
switch(config-g0/0/1)# lldp management-ip 90.0.0.99
switch(config-g0/0/1)#
```

## 1.1.8 show lldp neighbors

## Syntax

**show lldp neighbors**

It is used to display the simple information about neighbors.

## Parameter

None

## Default

None

## Usage Guidelines

The command is used to display the simple information about neighbors.

## Command Mode

EXEC / global configuration mode

## Example

```
switch(config)#show lldp neighbors
```

Capability Codes:

(R)Router,(B)Bridge,(C)DOCSIs Cable Device,(T)Telephone

(W)WLAN Access Point, (P)Repeater,(s)station,(O)Other

Device-ID	Local-Intf	Hldtme	Port-ID	Capability
switch	Gig0/0/2	115	Gig0/0/32	B
switch	Gig0/0/32	114	Gig0/0/2	B

Total entries displayed: 2

```
switch(config)#
```

### 1.1.9 show lldp neighbors detail

## Syntax

**Show lldp neighbors detail**

It is used to display the detailed information about the neighbor.

## Parameter

None

## Default

None

## Usage Guidelines

None

## Command Mode

EXEC/global configuration mode

## Example

```
switch(config)#show lldp neighbors detail
```

```
chassis id: 00e0.0f61.ca53
```

```
port id: Gig0/0/32
```

```
port description: GigaEthernet0/0/32
```

```
